

About traceability

Location: **Asset page > Traceability**

In Collibra Data Governance Center, you can display an asset's traceability. Traceability is essential for impact analysis. This feature helps you to quickly see to which other assets a specific asset is connected. Two assets are connected if you can navigate from one asset to another by traversing one or more relations.

With this feature, you can keep track of:

- Relationships between assets, even if they are indirect
- People involved with a specific asset
- References in other assets

Example: You can check the governance resources to which an asset is connected. You can find in which database tables a certain business term is stored.

Not every relation that is displayed in an asset's **Overview** tab is taken into account for the traceability.

- The **Overview** tab displays each relation type that is defined in the attribute assignment group of the asset type and the first relation type in a trace.
- The **Traceability** tab displays each relation type that is defined in the traceability assignment group of the asset type.
