

# Traceability Diagram tab

The traceability diagram is a feature to display and interact with many assets and relations in an easy-to-read diagram.

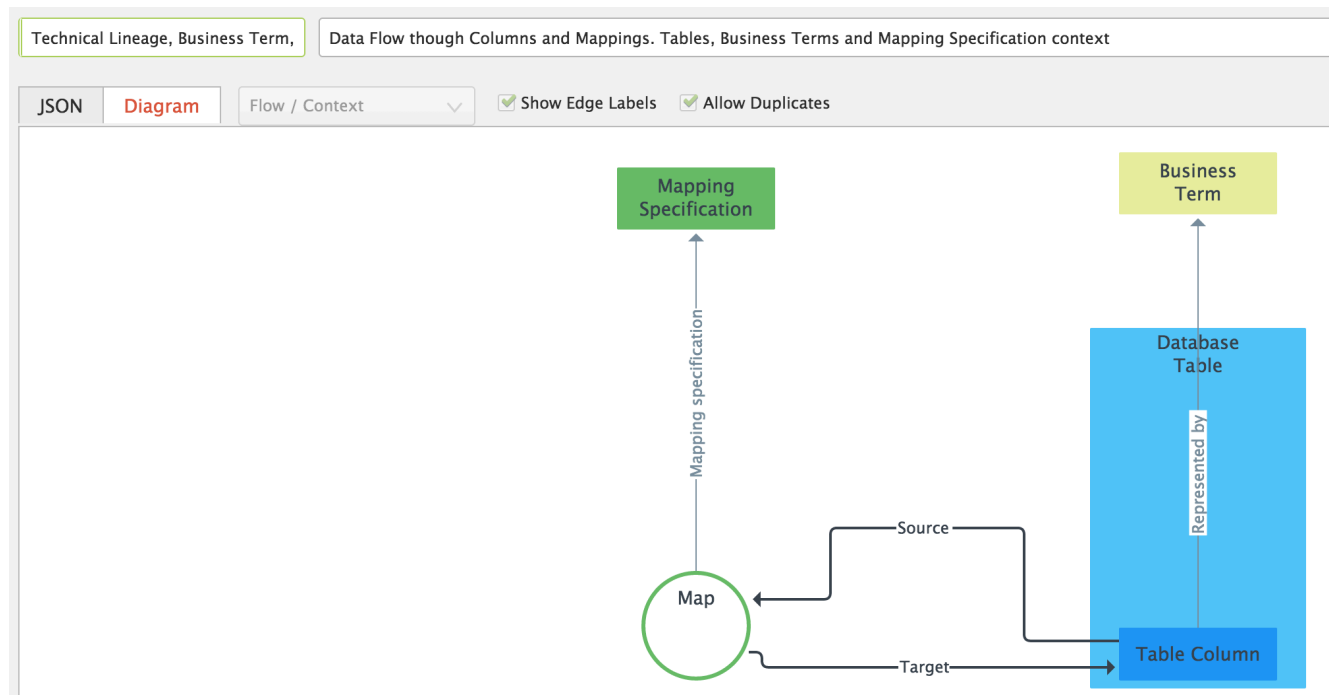

Location: **Asset page > Traceability > Diagram**

Below is an example of a traceability diagram:

The assets, relations and complex relations that are displayed here, as well as the way they are displayed, are determined by the diagram view that you have selected.

The view for the example diagram is shown below:

For more information, read the following sections:

#### **Traceability Groups and Diagram Views**

Please be aware that as of version 4.5, traceability groups still exist but they no longer govern traceability diagrams (they still govern the Add, Assets and People tabs).

Instead, **diagram views** now govern traceability diagrams.

If you upgrade to 4.5 from a DGC where you had defined traceability groups to govern traceability diagrams, you need to (manually) define diagram views in 4.5 that are similar to the traceability groups.

#### **New Traceability Diagrams are not available in IE8**

The new traceability diagram functionality (added in version 4.5) is not available for Internet Explorer 8.

When you open a 4.5 traceability diagram in IE8, you see an empty diagram with the recommendation to upgrade to a modern browser.
